

Lead Warming System

Add New Lead to Google Sheets

Python script - Tracking lead across social media and email, responding and commenting/sending emails on a regular basis

Keeps track of responses and has a lead warmth score out of 10.

Track when they view our emails or accounts and add them to a retargeting audience to target them with specific ads.

Instagram, Facebook, LinkedIn, Email, LVL 2, TEXT.

Text once every two weeks once the leads are warmed.

We want to primarily focus on

- Comments
- Emails
- Story replies
- Retargeting

AI

- Need data.
- General input: Analysis/Analytics
- General output: Working ads

● ***Input 1: The client and desired customer in the desired area***

● ***Output 1: Video scripts and shot ideas/editing style formats based on recent performance***

● ***Input 2: Choosing the right ad***

● ***Output 2: Shot outline, telling us exactly what to film and how***

● ***Input 3: Footage***

● ***Output 3: Edited ad***

REPEAT

(ORGANIC METRICS - EXTERNAL) Tad - Working on getting wide variety of data about video content - specifically ads, in order to inform us on what is working across patterns and what isn't working

(PAID ADS ANALYTICS - INTERNAL) ASHANE - Working on getting data internally about which ads are performing better based on what criteria

(ORGANIC METRICS - INTERNAL) JUSTIN/DANIEL - Finding out what is converting from organic the most, what hooks, what value props, what scripts, what tone is working for what industries

(SOFTWARE/AI TRAINING) JUSTIN/ASHANE/TAD - Code it.

How we collect data. What data we're collecting. How we apply that in the models.

These will answer the underlying question: "How do we get this ad to have the lowest cost per lead possible?"

When encountering an industry or customer base, we need to understand them as quickie as possible. This means collecting as much data ee can without it being proprietary. Organic access as much as possible. Having an ad library.

First thing we want to do

- **Input 1: The client and desired customer in the desired area**
- **Output 1: Video scripts and shot ideas/editing style formats based on recent performance**

Gather data on the target industry and target market of contractor

Answer:

- What ads are working on this customer base now
- What hooks are the most effective at keeping attention

Gathering short form video data, conversion data where possible, website cookies, anything to do that.

INPUT: ORGANIC AND PAID AD/ONLINE ANALYTICS AND ANALYSIS
OUTPUT: VIDEO IDEAS

- ***Input 2: Choosing the right ad***
 - ***User goes through different suggestions based on what is working, and build the video script with the model.***
 - ***Model analyze final script to see if it's going to work***
- ***Output 2: Shot outline, telling us exactly what to film and how***
 - ***JSON Object that is shot outline with all the media urls and text timestamps***
- ***Input 3: Footage***
 - ***MODEL CREATE shot templates***
 - ***Lays out footage that we need***
- ***Output 3: Edited ad***
 - ***Transcriptions to captions, timing and pacing optimizations, anything to do with that***
 - ***Model to try different editing styles***

Let's start collecting data on two industries to start. A. Tony (pools) and B. Marketing agencies like ourselves. This will be a good place to start testing for the videos and everything and figuring out what is working to train the model
